ROX PROTHROMBIN – 20 00 40
For In Vitro Research Use – Not For Diagnostic Use

1 INTENDED USE
For quantitative determination of Prothrombin (FII) functional activity in plasma and FII containing concentrates. The method is suitable for plasma collected in citrate or EDTA.

2 BIOCHEMISTRY
Factor II is a single chain vitamin K dependent glycoprotein of 72 kDa, which is activated to thrombin (FIIa) by FXa in the presence of FVa, calcium ions and phospholipids.

3 MEASUREMENT PRINCIPLE
FII functional activity is determined in a chromogenic prothrombinase method, in which human FII is activated to thrombin (FIIa) by human FXa in the presence of bovine FV, calcium ions and phospholipids.

The amount of FIIa formed is determined from the hydrolysis of a chromogenic FIIa substrate. The FII activity of the sample is assigned vs. plasma or a FII concentrate standard with FII potency expressed in International Units (IU).

The prothrombinase complex is sensitive to γ-carboxylation and therefore a-carboxy-FII is not activated in this method in contrast to snake venom based prothrombin methods.

4 KIT COMPOSITION
Activator Reagent, 3.0 mL (4 vials) – REF 2010
The Activator Reagent contains lyophilized human FXa, bovine FVa, CaCl2 and phospholipids. Each vial is sufficient for 25 tests.

FII Diluent Buffer, Stock Solution, 20 mL (1 vial) – REF 2050
Liquid stock solution of diluent buffer.

5 PRECAUTIONS AND WARNINGS

CAUTION: Each donor unit used in the preparation of the Activator Reagent has been tested by FDA approved methods for the presence of Hepatitis B surface antigen and antibodies to HIV 1 and 2 and Hepatitis C and found to be negative. However, since no test can completely rule out the presence of these blood borne diseases, the handling and disposal of this human source reagent should be made with care.

- Avoid contact with skin and eye.
- Do not empty into drains.
- Wear suitable protective clothing.

6 PREPARATION
Activator Reagent
Reconstitute with 3.0 mL water. Allow to stand for 5 min at 20-25°C with intermittent gentle mixing for complete reconstitution.

FII Substrate, 6 mL
Ready for use.

FII Diluent Buffer, Stock Solution, 20 mL
Dilute 1 + 9 with water to obtain a 0.05 mol/L Tris-HCl buffer working solution, pH 7.3 (20°C), with 1% bovine serum albumin.

Note: All reconstitutions and dilutions should be made with water of a quality of at least NCCLS Type II water or Ph Eur water for injection.

7 STORAGE AND STABILITY
The sealed reagents are stable at 2-8°C until the Expiry Date printed on the label. Be careful to avoid contamination of the reagents by microorganisms.

- Reconstituted Activator Reagent: Stability after reconstitution is 8 hours at 2-8°C, 2 hours at 20 - 25°C and 2 hours at 37°C.

- Chromogenic FII substrate:
  - Opened vial is stable for 1 month at 2-8°C.
  - FII Diluent Buffer:
    - Stock Solution: Opened vial is stable for 1 month at 2-8°C.
    - Buffer working solution should be used the same day as prepared.

8 MATERIALS REQUIRED BUT NOT PROVIDED
- Deionized water, NCCLS Type II water or Ph Eur water for injection or higher quality.
- Human Plasma or FII concentrate, potency assigned vs. a WHO International Standard for FII activity.
- Citric acid, 2% (for end-point method)
- Calibrated pipettes
- Photometer, 405 nm (and 490 nm for end-point method)
- Heat incubator 37°C
- Plastic test tubes and Vortex mixer
- Stop-watch

9 SYMBOLS USED

ENGLISH – Insert Revision 01/2013
11 METHOD – CONCENTRATES

A calibration curve should be included in each run. A Factor II concentrate calibrated against a WHO International Standard should be used as calibrator. Prepare all dilutions in plastic tubes.

11.1 Preparation of standard dilutions - FIL containing concentrates

Prepare independent predilutions for each standard dilution.

Example, using the 3rd International Standard for Factors II and X Concentrates 98/590 with an assigned Factor II activity of 11.2 IU/ampoule: Reconstitute one ampoule with 1.0 mL of distilled water followed by a predilution of 1:560 in Diluent Buffer-working solution to arrive at 20 mIU/mL. Prepare standard dilutions using the predilution of 20 mIU/mL according to the table below.

NOTE: The table below for preparation of standard dilutions is provided as an example only. Any dilution scheme resulting in final standard dilutions in the range 0.5 – 7.5 mIU/mL could be used.

<table>
<thead>
<tr>
<th>Predilution</th>

11.2 Sample dilution - FIL containing concentrates

Prepare sample dilutions in FII Diluent Buffer working solution to obtain activities in the range 0.5 – 7.5 mIU/mL. It is recommended to analyse FII concentrate samples at several different dilutions, starting at a FII activity of about 7.5 mIU/mL, to establish the minimal dilution required to avoid any matrix interference. All dilutions should be prepared in plastic tubes.

12 ASSAY – PLASMA AND CONCENTRATES

The same assay procedure should be used for both plasma and concentrates.

<table>

</tbody>
</table>

Kinetic reading:
Read the absorbance change at 405 nm. End-point method:
Stop the reaction with 2% citric acid after 10 min hydrolysis at 37°C. Read the absorbance at 405 nm, using 490 nm as reference wavelength. Absorbance readings should be made within 2 hours after termination of the substrate hydrolysis.

13 CALCULATION

Plasmas:
- Plot the maximal absorbance change/minute (ΔA405 ∆Abs/min) or absorbance (A405-490) vs. FII activity in a Lin-Lin graph. Use a quadratic curve fit (Fig 1).
- The FII activity of the tested sample is obtained directly from the calibration curve. Correct the obtained value with an appropriate correction factor if the FII activity of the normal plasma standard differs from 1 IU/mL.
- If several sample dilutions are used, adjust for the dilution with the appropriate dilution factor.
- Express the sample result as IU/mL or %.

14 PERFORMANCE CHARACTERISTICS

The assay allows detection of about 0.25 mIU/mL (5%) FII activity.

15 EXPECTED VALUES

Normal Factor II levels in plasma range from 0.75 - 1.3 IU/mL.

16 INTERFERENCE

Factor II results are not affected at plasma levels up to the stated levels below:

- Hemoglobin: 10 mg/mL
- Bilirubin: 800 µg/mL
- Triglycerides: 10 mg/mL
- Heparin, LMW: 4 U/mL
- Heparin, UF: 4 U/mL
