

ELISA Prekallikrein

Capture and detecting antibodies for the construction of an ELISA for the quantitative determination of prekallikrein.

Test principle

Micro wells are coated with prekallikrein antibodies (capture antibody), to which the prekallikrein from the sample binds. Unbound substances are removed by washing. A peroxidase conjugated detecting antibody is added and binds to the Prekallikrein/capture antibody complex. After a washing step, added enzyme reacts with the conjugate. The intensity of the resulting color is proportional to the prekallikrein content.

Reagents and stability (after opening)

Capture antibody 1 vial

Detecting antibody 1 vial

When stored at -20°C the reagents remain stable until the expiry date printed on the vials.

No. of determinations: 4 x 96

Article no.: PK-EIA
