

ELISA APC-Protein C Inhibitor-Complex

Capture and detecting antibodies for the construction of an ELISA for the quantitative determination of the APC-Protein C Inhibitor-complex.

Test principle

Micro wells are coated with antibodies against APC (capture antibody), to which APC-Protein C Inhibitor-complex from the sample binds. Unbound substances are removed by washing. A peroxidase conjugated anti-Protein C Inhibitor detecting antibody is added and binds to the APC-Protein C Inhibitor-complex. After a washing step, added enzyme substrate reacts with the conjugate. The intensity of the resulting colour is proportional to the APC-Protein C Inhibitor-complex content in the sample.

Reagents and stability (after opening)

Capture antibody	1 vial
Detecting antibody	1 vial

When stored at -20°C the reagents remain stable until the expiry date.

No. of determinations: 5 x 96

Article no.: APCPCI-EIA
